Routes of Exposure

Symptoms Summary

Acute Toxicity **Sodium lauryl sulfate** appears to be safe in formulations designed for discontinuous, brief use followed by thorough rinsing from the surface of the skin.
Source: J Am Coll Toxicol Vol:2, 7 (1983) pp 127-81
Lauryl Alcohol Ethoxylate: Ethoxylates with alkyl chains in the C12-18 range, being moderately acutely toxic by the oral route. By the dermal route - the relevant route of human exposure - it is not expected to produce skin irritation or systemic or reproductive toxicity at concentrations used in formulated cleaning products
Alkylpolyglucoside: Clinical tests of products containing alkyl glucoside ingredients have found that the products were not dermal irritants or sensitizers. According to the general provisions of the Cosmetics Regulation of the European Union
Cocamidopropylamine Oxide: Cocamidopropylamine Oxide solution was not a primary dermal irritant, not a sensitizer, although it did produce some reactions typical of mild irritation Cocamidopropylamine Oxide did not find evidence of dermal sensitization.
Cocamidopropyl Betaine: This product is not considered to be a carcinogen by IARC, ACGIH, NTP, or OSHA. This product is not expected to cause reproductive or developmental effects and any skin sensitization. It is nontoxic.

Name of Toxicological Synergistic Product:	None

Section 12: Ecological Information

General Ecological information:

Lauryl Alcohol Ethoxylate products starting from natural source are very quickly and easily degradable with degradability over 90% according to OECD test.

Cocamidopropylamine Oxide: Readily biodegradable (according to OECD criteria).

Cocamidopropyl Betaine: Readily biodegradable. No other adverse environmental effects (e.g. ozone depletion, photochemical ozone creation potential, endocrine disruption, global warming potential) are expected from this component

Alkylpolyglucoside was not a reproductive or developmental toxicant. Alkyl glucoside ingredients have not been found to be genotoxic, according to the general provisions of the Cosmetics Regulation of the European Union.

Sodium lauryl sulfate is readily biodegradable under aerobic and anaerobic conditions and, therefore, does not persist in the environment.^{8,37,45} SLS is considered a sustainable material because of its 100% bio based content, biodegradability, and low potential to bioaccumulation.

Section 13: Disposal Considerations

Waste disposal of the product;

Containerize minor spills for reuse where possible.

Larger quantities are disposed of per local and municipal regulations
